Abstract of the Disclosure

When a user selects plural saving after the user has prepared a file with the use of an application loaded from a file system, the application refers to a plural saving information memory device to read thereinto saving conditions needed for plural saving other than saving of an original file. The user designates a plurality of file saving destinations from the application and then sets the saving conditions. Then, when the plural saving is executed, only the file corresponding to the saving conditions is saved at the saving destinations thus set.
